                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                           The invention relates to a method for inhibiting the growth of non-solid tumour cells that are stimulated by a ligand of vascular endothelial growth factor receptor (VEGFR) in mammals particularly humans. The method involves treating the mammals with humanised VEGFR monoclonal antibodies (antagonidis). Humanised wonstant region, where the humanised mouse variable region of nontains mouse complementarity determining region (CDR) grafted into human variable region. The method is useful for treating jeukaemias such as acute or chronic myelocytic leukaemia, acute or chronic lymphocytic leukaemia, erythrocytic or monocytic leukaemia, multiple myelomas and lymphoid cells, particularly those related to antibody minime heavy chain hypervariable region (VH) CDR-2 used in the exemplification of the invention.
Inhibiting growth of non-solid tumor cells useful to treat bone marrow tumors such as leukemias or multiple myeloma comprises treatment with an antagonist of a vascular endothelial growth factor receptor -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The present sequence is that of complementarity determining region (See also AAB8701) of IMC-ICI, a mouse-human chimeric antibody that has vascular inforced. The inforced and inforced and inforced activity. The antibody, or a fragment of it, can be used as an anti-angiogenic molecule, cor a fragment of it, can be used as an anti-angiogenic molecule, cor or a fragment of it, can be used as an anti-angiogenic molecule, and of properties generally to a method of treating or the invention relates generally to a method of treating or controlling an angiogenic dependent condition by administering an anti-angiogenic molecule and a chemotherapeutic agent, to produce a regression or arrest of the condition while minimising or preventing significant toxicity of the chemotherapeutic agent. The anti-angiogenic molecule inhibits or blocks the action of a vascular endothelium survival factor such as VEGF or its receptor, and is especially IMC-ICII. Conditions that can be treated include
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Heavy chain complementarity determining region H2 (CDRH2) version #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Complementarity determining region; CDR; CDRH2; antigen; cytostatic; anglogeneeis inhibitor; vascular endothelial growth factor receptor; VEGF; tumour; leukaemia; antibody; cell proliferation inhibitor; antibody heavy chain variable domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and is especially IMC-ICII. Conditions that can be treated include a neoplasm, a collagen-vascular disease or an autoimmune disease, especially a solid tumour, including breast carcinoma, unng carcinoma, prostate carcinoma, colon carcinoma, prostate carcinoma, ovarian carcinoma, neuroblastoma, central nervous system tumour, neuroblastoma multiforme or melanoma (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) light chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of the Cl domain. (I) is useful for: neutralising the activation of a vaccular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting vEGF induced migration of human leukaemia cells; blocking interaction of a protein and its ligand; promoting interaction; inhibiting vEGF induced migration of human leukaemia cells; blocking interaction of a protein and its ligand; promoting interactions between immune cells and target cells; and in vivo and in vitro for investigative, diagnostic or treatment methods. The design of (I) provides for efficient production so that substantially all of the antigen-binding proteins produced are assembled in the design of (I) provides for efficient and bispecific, homogeneous and in tetrameric form. The heavy chain constant domains which constitute antibody and which provide other antibody functions can be present. There is no requirement for processing in vitro to obtain the complete product. The perpites esquence represents the heavy chain variable domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Vascular endothelial growth factor receptor; VEGFR; antagonist; tumour; cytostatic; heavy chain; myelocytic leukaemia; lymphocytic; erythrocytic; monocytic; multiple myeloma; lymphoid cell; Hodgkin's disease; mouse;
                                                                                                                                                                                                                                                                                                                                                                                                                     complementarity determining region H2 (CDRH2) version #2 incorporated into an antigen-binding protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inhibiting growth of non-solid tumor cells useful to treat bone marrow tumors such as leukemias or multiple myeloma comprises treatment with an antagonist of a vascular endothelial growth factor receptor -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

      The invention relates to a method for inhibiting the growth of non-solid tumour cells that are stimulated by a ligand of vascular endothelial growth factor receptor (VEGER) in mammals particularly humans. The method involves treating the mammals with humanised veger monoclonal antibodies (antagonists). Humanised monoclonal antibody comprises humanised mouse variable region joined to human constant region, where the humanised mouse variable region of ontains mouse complementarity determining region (CDR) grafted into human variable region. The method is useful for treating leukaemias such as acute or chronic myelocytic leukaemia, acute or chronic lymphocytic leukaemia, erythrocytic or monocytic leukaemia, multiple myelomas and lymphoid cells, particularly those related to non-Hodgkin's and Hodgkin's disease. The present sequence is humanised antibody heavy chain fragament used in the exemplification of the
                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               disease;

                                                                                                                                             The present sequence is that of the heavy chain variable region of another in a mouse-human chimeric antibody that has vascular endothelia growth factor (VEGF) antagonist activity. The antibody, or a fragment of it, can be used as an anti-angiogenic molecule, together with a chemotherapeutic acid, for the treatment of an angiogenic dependent condition in a mammal, especially a human. The invention relates generally to a method of treating or controlling an angiogenic dependent condition by administering an inti-angiogenic molecule and a chemotherapeutic agent, to produce a regression or arrest of the condition while minimising or preventing significant toxicity of the chemotherapeutic agent. The antifangiogenic molecule inhibits or blocks the action of a vascularizandothelium survival factor such as vesce tor; and is especially INC-IC11 Conditions that can be treated include a neoplasm, a collagen-vascular disease or an autoimmune disease, especially incommune, including breast carcinoma, lung carcinoma, prostate carcinoma, covarian gearcinoma, neuroblastoma multiforme or melanoma (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   bispecific immunoglobulin-like antigen-binding protein for reducing

                                                                                                                                                                                                                                     (VEGF) receptor; reducing tumour growth; inhibiting angiogenesis; reducing tumour growth; inhibiting angiogenesis; reducing endothelial cell proliferation; inhibiting VEGF induced migration of human leukaemia cells; blocking interaction of a protein and its ligand; promoting interactions between immune cells and target cells; and in vivo and in vitro for investigative, diagnostic or treatment methods. The design of (1) provides for efficient production so that substantially all of the antigen-binding proteins produced are assembled in the desired configuration. (1) is bivalent and bispecific, homogeneous and in tetrameric form. The heavy chain constant domains which constitute the Fc region (e.g., CH2 and GH3 for an IgG molecule) of a natural antibody and which provide other antibody functions can be present. There
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 is no requirement for processing in vitro to obtain the complete product. This sequence represents a heavy chain variable domain (VH) incorporated into Fv, an engineered protein containing a heavy chain variable domain and a light chain variable domain in one polypeptide chain, described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cytostatic; heavy chain; myelocytic leukaemia; lymphocytic; erythrocytic; monocytic; multiple myeloma; lymphoid cell; Hodgkin's disease; chimeric;
                                                                                                   The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (Pl) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) light chain constant domain (Cl domain), and P2 has an antigen-binding site located to the N terminus of the CHl domain. (I) is useful for: neutralising the activation of a vascular endothelial growth factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vascular endothelial growth factor receptor; VEGFR; antagonist; tumour;

                                                                                                                                                                                                                                                                                     The invention relates to a method for inhibiting the growth of non-solid tumour cells that are stimulated by a ligand of vascular endothelial growth factor receptor (VEGFR) in mammals particularly humans. The method involves treating the mammals with humanised VEGFR monoclonal antibodies (antagonists). Humanised monoclonal antibody comprises humanised mouse variable region joined to human constant region, where the humanised mouse variable region contains mouse complementarity determining region (CDR) grafted into human variable region. The method is useful for treating leukaemias such as acute or chronic myelocytic leukaemia, criticalial myelomas and lymphoid cells, particularly those related to non-Hodgkin's and Hodgkin's disease. The present sequence is chimeric picli lige expression vector. Chimeric picli heavy chain fragment which is used for the construction of chimeric contains human lgG1 (gamma) heavy chain contains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                   Inhibiting growth of non-solid tumor cells useful to treat bone marrow tumors such as leukemias or multiple myeloma comprises treatment with an antagonist of a vascular endothelial growth factor receptor -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of the heavy chain variable region of IMC-1C11, a mouse-human chimeric antibody that has vascular endothelial growth factor (VEGF) antagonist activity. The antibody, or a fragment of it, can be used as an anti-anglogenic molecule, together with a chemotherapeutic acid, for the treatment of an anglogenic dependent condition in a mammal, especially a human. The invention relates generally to a method of treating or controlling an anglogenic dependent condition by administering an anti-anglogenic molecule and a chemotherapeutic agent, to produce a cyression or arrest of the condition while minimising or preventing significant toxicity of the chemotherapeutic agent.

The anti-anglogenic molecule inhibits or blocks the action of a vascular endothelium survival factor such as VEGF or its receptor,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             and is especially IMC-1C11. Conditions that can be treated include a neoplasm, a collagen-vascular disease or an autoimmune disease, especially a solid tumour, including breast carcinoma, lung carcinoma, prostate carcinoma, colon carcinoma, prostate carcinoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ovarian carcinoma, neuroblastoma, central nervous system tumour, neuroblastoma, glioblastoma multiforme or melanoma (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Treating or controlling an angiogenic dependent condition (e.g. neoplasm, collagen-vascular or autoimmune disease) in mammal by administering a combination of an antiangiogenic molecule and a

The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigenablinding site located to the N terminus of immunoglobulin (Ig) antigenablinding site located to the N terminus of immunoglobulin (Ig) (Ight chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of the CH1 domain. (I) is useful for: neutral sing the activation of a vascular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting angiogenesis.

CC (VEGF) receptor; reducing tumour growth; inhibiting vEGF induced migration of human leukaemia cells; blocking interaction of a protein and its ligand; promothing interactions between immune cells and target cells; and in vivo and in vitro for investigative, diagnostic or treatment centended; The design of (I) provides for efficient production so that substantially all of the antigen-binding proteins production so that cand in ferrament for methods. The design of (I) provides for efficient production so that cand in ferrament for provide other antibody functions can be present. There the Fefreedian (e.g., CH2 and CH3 for an IgG molecule) of a natural contained and which provide other antibody functions can be present. There can be equirement for processing in vitro to obtain variable fragment (CF This is the amino acid sequence of a single chain variable light and variable haven the method of the five containing a variable light and variable in the method of the five containing a variable in the method of the containing and the complete produced to the variable in the method of the containing and processing in the method of the containing a variable in the method of the containing a variable in the method of the containing a variable in the method of the containing and processing in the method of the containing and containing and containing and containing and containing and containing and containi invention.

The present invention describes the use of an immunogen (A) to induce anti-tumour immunity; to elicit an increased immune response to tumour associated antigen (TAA) and/Or to induce an immune response to mutant or wild-type forms of TAA in mammals. (A) is: (i) a monoclonal antibody or wild-type forms of TAA in mammals. (A) is: (i) a monoclonal antibody (ADA) to TAA, or its fragment; (ii) a peptide based on a CDR (Complementarity determining region) on the heavy or light chain of MAD (able to elicit antibodies to TAA); or (iii) a DNA that encodes the variable (V) region of MAD, in a gene delivery vehicle. The present sequence represents a peptide based on CDR2 of the heavy chain of sequence represents a peptide based on CDR2 of the heavy chain of sequence represents a peptide based on CDR2 of the heavy chain of specific, anti-DNA antibodies (AD) by immunising a mammal with a MAD directed to a domain containing a DNA-binding site of a DNA-binding content. (A) is used to treat a wide variety of primary and metastatic cancers, particularly those where p53 is involved. Ab are used for diagnosis (e.g to determine critical sequences in animal or plant contentage; in gene sequencing and cloning; also possibly for activation of selected therapeutic genes in plants, animals and humans. (A) induce

The antibodies neutralise KDR activation. The immunoglobulin may be a multivalent single chain antibody, a monovalent single chain antibody, a diabody, a criabody, a monovalent single chain antibody, a diabody, a criabody a monovalent single chain antibody.

The immunoglobulin molecules bind specifically to an certracellular domain of the KDR receptor with the same affinity as VEGF. Overexpression of VEGF has been implicated in a number of human tumour cell lines including glioblastoma multiforme, chemangioblastoma, central nervous system neoplasms and AIDS associated Karposi's sarcoma. The antibodies therefore have applications in treating these conditions. This sequence encodes a preferred heavy chain complementary determining region of the

The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) light chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of the CHI domain. (I) is useful for: neutralising the activation of a vaccular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting vEGF induced migration of human leukaemia cells; blocking interaction of a protein and its ligand; promoting interactions between immune cells and target cells; and in vivo and in vitro for investigative, diagnostic or treatment methods. The design of (I) provides for efficient production so that substantially all of the antigen-binding proteins produced are assembled in the desired configuration. (I) is bivalent and bispecific, homogeneous and in tetrameric form. The heavy chain constant domains which constitute antibody and which provide other antibody functions can be present. There is no requirement for processing in vitro to obtain the complete product. The provides the heavy chain constant domain the complete product. The first performance is no requirement for processing in vitro to obtain the complete product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           complementarity determining region H2 (CDRH2) version \#1 incorporated into an antigen-binding protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Heavy chain complementarity determining region H2 (CDRH2) version #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The patent discloses a method for the treatment of systemic lupus erythematosus (SLE) by down-regulating the autoimmune response to the C-terminal DNA-binding domain of p53 protein by an active compound. The present sequence is a PAD-421 H2 peptide which comprises the complementarity determining region (CDR) of the heavy chain of a monoclonal antibody PAD-421 which is specific to the C-terminal DNA-binding domain of murine p53 protein. The peptide corresponds to residues 48-67 of PAD-421 heavy chain variable region. It is an example of the active compound useful in the diagnosis, prevention
                                                                                                                                                                                     Murine an蝕-p53 PAb-421 mAb heavy chain CDR based peptide PAb-421 H2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treatment of systemic lupus erythematosus by down-regulating the autoimnume response to the C-terminal DNA-binding domain of the p53 protein by an active compound comprising of antibodies to p53 or fragments of p5.

anti-tumour immunity; to elicit an increased immune response to tumour associated antigen (TAA) and/or to induce an immune response to tumour associated antigen (TAA) and/or to induce an immune response to mutant or wild-type forms of TAA in mammals. (A) is: (1) a monoclonal antibody (MAD) to TAA, or its fragment; (ii) a peptide based on a CDR (complementarity determining region) on the heavy or light chain of MAD (complementarity determining region) on the heavy or light chain of MAD (complementarity determining region) on the heavy or light chain of MAD (complementarity determining region) on the heavy or light chain of MAD (complementarity determining region) on the heavy or light chain of MAD (complementarity determined delivery vehicle. The present sequence represents the variable heavy chain sequence from anti-PS3 MAD (compain containing a method for generating sequence-specific, anti-DNA antibodies (AD) by immunising a memmal with a MAD directed to a domain containing a DNA-binding site of a DNA-binding protein. (A) is used to treat a wide variety of primary and metastatic cancers, contentive and other parasites; to determine parentage; in forestic sequencing and cloning; also possibly for activation of selected the characteristic genes in plants, animals and humans. (A) induce an effective anti-tumour response without causing harm to the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Murine anti-p53 monoclonal antibody PAb-421 heavy chain variable region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          uses (A) to generate anti-TAA by exploiting the anti-idiotype network
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes the use of an immunogen (A) to induce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                         Anti-p53; monoclonal antibody 240; immunogen; anti-tumour; immunity; immune response; tumour associated antigen; metastatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Use of a monoclonal antibody to a tumour-associated antigen - to induce anti-tumour immunity or elicit an increased immune response
Anti-p53 monoclonal antibody 421 variable heavy chain sequence

The present sequence is a heavy chain variable region of monoclonal antibody PAb-421 which is specific to the C-terminal DNA-binding domain of murine p53 protein. PAb-421 antibody and peptides based on complementarity determining regions of light and heavy chain variable regions of the antibody, are examples of active compounds useful in the diagnosis, prevention and treatment of SLE in humans.

                                       STALIC-ACID DEPENDENT TYPE I MEMBRANE PROTEIN (ISOFORM 1) AND SOLUBLE (ISOFORM 2).

-I- FUNCTION: MACROPHAGE-RESTRICTED ADHESION MOLECULE THAT MEDIATES STALIC-ACID DEPENDENT BINDING TO CELLS.

-I- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN (ISOFORM 1) AND SOLUBLE (ISOFORM 2).

-I- ALTERNATIVE PRODUCTS: 2 1soforms; 1 (shown here) and 2; are produced by alternative splicing.

-I- SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUBERFAMILY.

-I- SIMILARITY: CONTAINS 1 IMMUNOGLOBULIN-LIKE V-TYPE DOMAINS.

-I- SIMILARITY: CONTAINS 16 IMMUNOGLOBULIN-LIKE C2-TYPE DOMAINS.

-I- DATABBASE: NAME-PROW, NOTE-PROW, 2:18-22(2001); WWW-"http://www.ncbi.nlm.nih.gov/prow/guide/985165905_g.htm".

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nature 408 816-820(2000).

-!- CATALYTIC ACTIVITY: ATP + N(2)-formyl-N(1)-(5-phospho-D-ribosyl)glycinamide + L-glutamine + H(2)0 - ADP + phosphate + 2-formamido)-N(1)-(5-phospho-D-ribosyl)acetamidine + L-glutamate.
-!- PATHWAY: De novo purine blosynthesis; fourth step.
-!- SUBCELLULAR LOCATION: Chloroplast (Probable).
-!- SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE FGAMS

    -!- SIMILARITY: CONTAINS 1 TYPE-1 GLUTAMINE AMIDOTRANSFERASE DOMAIN.

                                                                                                                 16-OCT-2001 (Rel. 40, Last sequence update)
15-UNN-2002 (Rel. 41, Last annotation update)
15-UNN-2002 (Rel. 41, Last annotation update)
Purbable phosphorthosylformylglycinamidine synthase, chloroplast
Precursor (EC 6.3.5.3) (FCAM synthase) (FGAMS) (Formylglycinamide
ribotide amidotransferase) (FGARAT) (Formylglycinamide ribotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PHOSPHORIBOSYLFORMYLGLYCINAMIDINE
